

Rudplan's team of experts provides services to fulfil requirements in terms of environmental audit to the mining and mineral processing industry.

The need to carry an environmental audit varies depending on the type of organisation and the objectives of the audit. Typically an environmental audit will identify and evaluate potential liabilities, risks and hazards. The organisation can then satisfy itself that it is complying with current and expected future legislation while demonstrating to its client their environmental performance.

Rudplan's offers clients the benefit of a wide range of experience in several types of environmental audit.

Services:

- Environmental compliance audit to verify the compliance of the facility with environmental legislation, regulations, authorisations, approvals etc.;
- Technical audit to assess a particular operation or process in order to verify if it is having a detrimental effect on the environment;
- Environmental management program audit.
